RADITYA MULYA AKBAR

radityama8@gmail.com | linkedin.com/in/raditya-mulya-akbar | github.com/Raditxt

Computer and Network Engineering student at Politeknik Negeri Ujung Pandang, on the software engineering track and focusing on backend and web development. I mostly work with TypeScript, React, Next.js, MySQL and PostgreSQL, and have gained hands-on experience through a front-end internship. I'm currently part of the AI Engineer cohort at Asah led by Dicoding. I'm looking for a software engineering internship where I can keep learning, take feedback well, and grow alongside a supportive team.

Work Experiences

Metrotech Digital Asia - **Jl. Toddopuli 10 No.15, Borong, Kec. Manggala, Kota Makassar, Sulawesi Selatan 90222** Mar 2022 - Jun 2022

Junior Web Developer

Metrotech Digital Asia is an innovative boutique software house and digital solution agency that delivers integrated tech products for local and global markets. The company specializes in custom application development, UI/UX design, and advanced technology integrations (AI & VR). It holds a strong track record of engineering high-impact solutions for smart cities, public infrastructure, healthcare systems, and private enterprises.

- Worked on a news blog website for a media client, a project scoped to cover both front-end and back-end
- Took ownership of the front-end in a small, short-staffed team, building the site's pages and UI components with React.js

Education Level

POLITEKNIK NEGERI UJUNG PANDANG - **Jl. Politeknik, Tamalanrea Indah, Kec. Tamalanrea, Kota Makassar, Sulawesi Selatan 90245** Sep 2023 - Jul 2027 (Expected)

Bachelor of Applied Science in Computer and Network Engineering. A hands-on applied science program focusing on network architecture, cyber security, and system administration. Equipped with practical skills in designing, implementing, and managing robust IT infrastructures using enterprise-grade technologies. GPA 3.64/4.00

- The program offers three specialization tracks: data engineering, network administration, and software engineering. I focus on the software engineering track.

SMK TELKOM MAKASSAR - **Jl. A. P. Pettarani No.4, Gn. Sari, Kec. Rappocini, Kota Makassar, Sulawesi Selatan 90221** Jul 2020 - May 2023

Senior High School, TKJ (Computer and Network Engineering) at SMK Telkom Makassar is a flagship vocational program designed to prepare students for the rapidly evolving digital world. As part of the prestigious Telkom Schools network, this major combines a rigorous academic curriculum with hands-on, industry-standard technical training.

- Hands-on training in Linux (Debian) server setup, LAN/WAN design, MikroTik routing, and network troubleshooting

Skills, Achievements & Other Experience

- **Course / Certification** ✓ (2024): Basic JavaScript Back-End Development – Dicoding Indonesia
  Completed a 45-hour intensive course on back-end development aligned with AWS standards. Mastered Node.js fundamentals, asynchronous file systems, modularization, and RESTful API architecture. Built native and framework-based (Hapi) web services, performed automated API testing with Postman, and deployed applications on Amazon EC2.
- **Course / Certification** ✓ (2024): Basic JavaScript Programming – Dicoding Indonesia
  Completed a 46-hour comprehensive course on core JavaScript programming aligned with AWS industry standards. Mastered fundamental syntax, data structures (Map, Set, Object, Array), OOP, Functional Programming, and ECMAScript modularization. Gained hands-on experience in asynchronous JavaScript (Promises, Async/Await), error handling, and writing clean, maintainable code in a Node.js runtime environment.

- **Course / Certification** ☑ (2024): AWS Cloud and Generative AI Fundamentals – Dicoding Indonesia
  Completed a 13-hour course covering fundamental cloud computing concepts and AWS Cloud infrastructure aligned with AWS international competency standards. Acquired core knowledge in AWS computing (EC2, ELB), global infrastructure, networking (VPC, Security Groups), storage & databases (S3, EBS, DynamoDB), identity & security (IAM, Shared Responsibility Model), monitoring (CloudWatch, CloudTrail), pricing models, and AWS Generative AI/Machine Learning fundamentals.
- **Course / Certification** ☑ (2024): Front-End Web Development for Beginners – Dicoding Indonesia
  Completed a 45-hour course focused on building interactive web applications per industry standards. Mastered Browser Object Model (BOM) and Document Object Model (DOM) manipulation using JavaScript, implemented event handling for dynamic UI interactions, and integrated client-side persistence using Web Storage APIs (LocalStorage/SessionStorage). Built a functional front-end web application as the final project.
- **Course / Certification** ☑ (2024): Spec-Driven Development with Kiro – Dicoding Indonesia
  Completed a 10-hour course on Spec-Driven Development (SDD) for AI-assisted software engineering. Mastered structured technical specification design, prompt engineering for transforming business requirements into executable technical plans, and managing end-to-end development cycles using Kiro. Learned industry best practices for maintaining architectural consistency, AI code reviews, and clean code principles in modern web development.
- **Projects** (2026): Waregos | POS & Inventory System for a Grocery Store (in progress) · github.com/Raditxt/waregos
  - Building a point-of-sale and stock management system for my family's grocery store, aimed at hidden losses: expired stock, dead stock, and end-of-day cash discrepancies
  - Designed a REST API with Node.js, Fastify, Prisma, and PostgreSQL covering sales (cash, QRIS, customer credit), restocking with moving-average cost, per-batch expiry tracking, and daily cash closing
  - Kept a reliable audit trail: restock records are immutable, stock corrections require a reason, and customer debt uses an append-only ledger
  - Built a responsive dashboard with Next.js, React, Tailwind CSS, and shadcn/ui, with role-based access so cashiers can't see cost prices or margins
  - Documented key technical decisions in 5 ADRs and set up encrypted daily database backups with GitHub Actions, in a Turborepo monorepo
- **Projects** (2026): Finance Tracker (in progress) · github.com/Raditxt/finance-app
  - Building a personal finance tracker with a REST API written from scratch in Bun + Hono on SQLite, and a Svelte 5 + TypeScript frontend
  - Implemented transaction CRUD, custom income/expense categories, and a monthly dashboard with savings rate, with validation on both client and server
- **Projects** (2026): TahuHak | Plain-Language Legal Information for Indonesians (in progress) · github.com/Raditxt/TahuHak
  - Building a free web app that helps people find the laws relevant to everyday problems (layoffs, illegal lending, online fraud) and explains them in plain language, covering national laws and South Sulawesi/Makassar regional regulations
  - Built a Node.js ingestion CLI that extracts official regulation PDFs (pdfjs) and parses them into articles, clauses, and explanations stored in PostgreSQL with Drizzle ORM; 3 regulations ingested so far, covered by Vitest tests
  - Designed for accuracy: answers are assembled only from verified articles rather than generated by AI, each article shows its original text and legal status (in force, amended, revoked), and article version history is linked
  - Scoped the first feature from research on public complaint data, and documented product and technical decisions in ADRs, a glossary, and labeled GitHub Issues
